

# Case Study

## Grass-filled porous paver for overflow car parking

Client: COOLINGS Garden Centre  
Location: Knockholt, Kent  
Product: BODPAVE™40 grass reinforcement paving grids  
Application: Grassed car park (1000m<sup>2</sup>)

### ISSUE

Coolings garden centre has a thriving business in the horticultural and domestic garden markets. Car parking space at their premises in Knockholt was at capacity. A grassed area in front of the main entrance was occasionally used as an overflow car park but problems with vehicles wearing the grass surface, creating ruts and the area becoming a muddy mess in wet conditions required action. The need for space together with a solid reinforced grassed surface was required.

### SOLUTION

BODPAVE 40 was specified to be laid onto the existing grassed surface which included a previously laid reinforcement mesh to add further strength to the sub-base. The original surface was level and BODPAVE 40 was quick to install. The client was very impressed with the pavers' integral ground spike which also connected the pavers to others. Once the pavers were laid, the area was rolled to bed the pavers securely flat. The cells were filled with a mixture of compost/topsoil and seeded. By April the site was fully established and was being used on a daily basis for overflow car parking.

### BENEFITS

BODPAVE 40 grids were laid in December 2007 and the installation completed within a few days. The area was in full operation as a grassed car park by April 2008. BODPAVE 40 was specified due to its ease of installation and offered the required surface to act as a grassed car park designed to be used on a daily basis. The pavers' open cells allow full grass growth and 100% natural rainwater penetration.
